---

## Disclosures

No relevant conflicts to disclose.

---

---

---

---

---

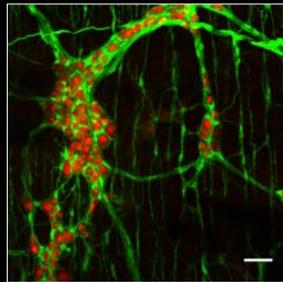

---

---

---

## Enteric nervous system (ENS)

- Can function independently of CNS
- Regulates:
  - Gastrointestinal motility
  - Secretion
  - Mucosal maintenance
  - Mucosal immunity
  - Hormonal secretion

Neurons, Glia

---

---

---

---

---

---

---

---

## Enteric glia are essential for GI function

- Chemical ablation (HSV-Tk + ganciclovir)
  - Severe jejunoileitis
  - Altered epithelial proliferation
  - Altered epithelial barrier
  - Neuronal degeneration

Bush et. al., Cell, 1998.

- Immune-mediated targeting of enteric glia

*These methods all targeted GFAP-expressing cells.*

---

---

---

---

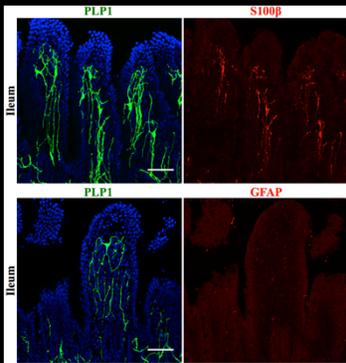

---

---

---

---

## Proteolipid protein 1 (PLP1) is a new marker of enteric glia

Rao, M., et al. *Glia*, 2015.

---

---

---

---

---

---

---

---

## Genetic model for conditional ablation of enteric glia

**PLPCreERT:** Expresses tamoxifen-inducible Cre recombinase within PLP1-expressing cells

**Experimental groups:**

- Cre+, Tamoxifen
- Cre-, Tamoxifen

How does loss of enteric glia affect gastrointestinal function?

- Intestinal-epithelial barrier: No effect
- Epithelial proliferation & repair: No effect
- Enteric neurons
  - Survival: No effect
  - Function: ?

---

---

---

---

---

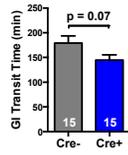

---

---

## Enteric glial loss alters neuronal function

---

---

---

---

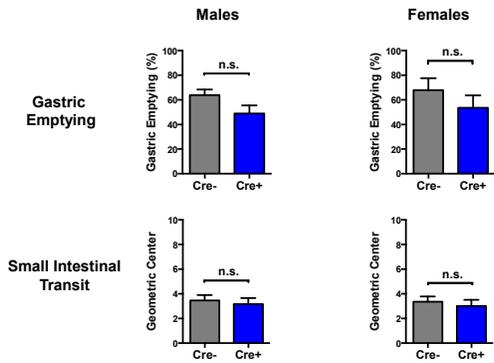

---

---

---

---

## Enteric glial loss does not alter UGI transit

---

---

---

---

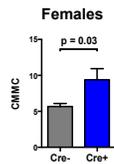

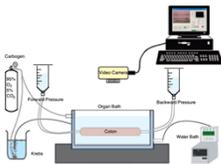

---

---

---

---

## Analyzing colonic motility *ex vivo*

---

---

---

---

---

---

---

---

## Summary

- Enteric glia widely express PLP1
- Conditional expression of DTA in PLP1-expressing cells is a robust, non-inflammatory model of enteric glial ablation
- Enteric glia play a sexually dimorphic role in colonic motility

Does this underlie sex differences in functional disorders?
